1 Introduction

Quectel LG290P (03) GNSS module supports GPS, GLONASS, Galileo, BDS, QZSS and NavIC (IRNSS) constellations (Default constellations: GPS + GLONASS + Galileo + BDS + QZSS + NavIC). Concurrent tracking of GPS L1 C/A, GPS L1C [1)], GPS L2C, GPS L5-Q, GLONASS G1 C/A, GLONASS G2 C/A, Galileo E1, Galileo E5a, Galileo E5b, Galileo E6, BDS B1I, BDS B1C, BDS B2a, BDS B2b, BDS B2I, BDS B3I, QZSS L1 C/A, QZSS L1C [1)], QZSS L2C, QZSS L5-Q, NavIC L5 frequency bands provides fast and accurate acquisition and makes this module an ideal solution for positioning and navigation in various vertical markets.

This document describes the software commands that are needed to control and modify the module configuration. The software commands are NMEA proprietary commands defined by Quectel (PQTM commands). To report GNSS information, the module supports message outputting in NMEA 0183 protocol and RTCM protocol format.

The LG290P (03) module supports the following protocols:

Table 1: Supported Protocol

Protocol	Type
NMEA 0183 V4.11	Output, ASCII, standard
	Input/output, ASCII, proprietary
RTCM 10403.3	Input/output, binary

NOTE

1. [1)] The LG290P (03) module supports GPS L1C and QZSS L1C frequency band which is still under development. Contact Quectel Technical Support (support@quectel.com) for details.
2. Quectel assumes no responsibility if commands other than the ones listed herein are used.

2.1. Structure of NMEA Protocol Messages

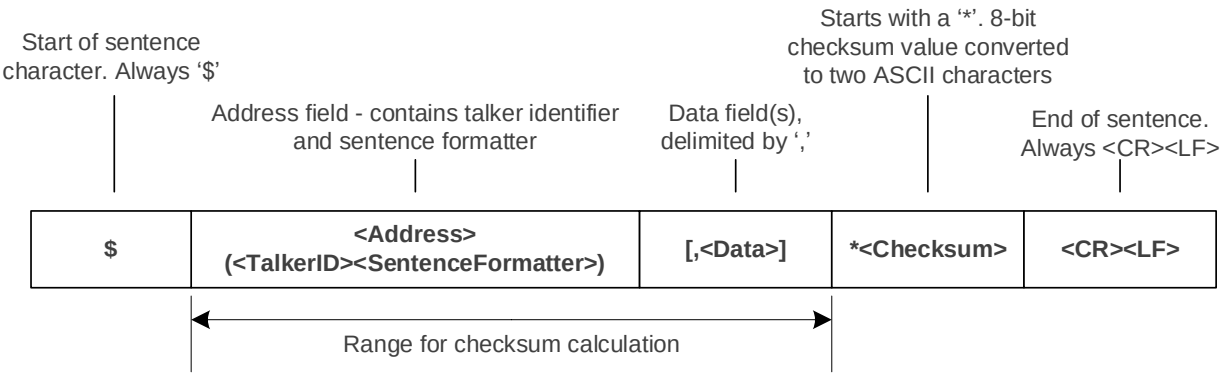

Figure 1: Structure of NMEA Protocol Messages

Table 2: Structure of NMEA Protocol Messages

Field	Description
$	Start of the sentence (Hex 0x24).
<Address>	**In Standard Messages:** In standard messages, this field consists of a two-character talker identifier (TalkerID) and a three-character sentence formatter (SentenceFormatter). The talker identifier identifies the type of talker. For more information on the TalkerID, see *Table 3: NMEA Talker ID*. The sentence formatter identifies the data type and the string format of the successive fields. **In Proprietary Messages:** In proprietary messages, this field consists of the proprietary character **P** followed by a three-character Manufacturer's Mnemonic Code, used to identify the TALKER issuing a

Field	Description
	proprietary sentence, and any additional characters as required.
<Data>	Data fields, delimited by the data field delimiter **‘,’**. Variable length (depending on the NMEA message type).
<Checksum>	Checksum field follows the checksum delimiter character *****. Checksum is the 8-bit exclusive OR of all characters in the sentence, including **‘,’** the field delimiter, between but not including the **$** and the ***** delimiters.
<CR><LF>	End of sentence (Hex 0x0D 0x0A).

NOTE

1. If the configuration message is a PQTM message, use **<MsgVer>** field to specify the message version, otherwise an error will be returned.
2. If the configuration message is a standard NMEA message/RTCM message (excluding RTCM MSM message), or it is unnecessary to set the message version, the **<MsgVer>** field can be omitted.
3. All RTCM MSM messages have the same **<Rate>** value and only the last setting is valid. For details on RTCM MSM messages, see *Chapter 3 RTCM Protocol*. The epoch time is aligned to **<FixInterval>** × **<Rate>**. For details on **<FixInterval>**, see *Chapter 2.3.28 PQTMCFGFIXRATE*.
4. The output time for RTCM MSM messages is influenced by the **<Offset>** value via the formula: Output Time = **<FixInterval>** × **<Rate>** + **<FixInterval>** × **<Offset>**. If the **<Offset>** in other previously configured messages exceeds the range from 0 to **<Rate>** - 1 due to reconfiguring **<Rate>** in new messages, it is necessary to change the **<Offset>** in the conflicting messages to 0. This process is automatically implemented by software.
5. The RTCM EPH message output rate is independent of the **<FixInterval>**.
6. The message output rate of **GSA** and **GSV** messages is fixed at 1 Hz and independent of **<FixInterval>**.

2.3.22. PQTMCFGSVIN

Sets/gets the Survey-in feature. This feature can determine the antenna location either by Survey-in mode or Fixed mode.

In order to work as a base station, the module external antenna should be mounted on a static point (try to mount it with a clear sky visibility). The antenna accurate coordinate location can be acquired through a self-survey process. The Survey-in mode (**<Mode>** = 1) determines the receiver's position by building a weighted mean of all valid 3D positioning solutions. You can set values of **<CFG_CNT>** and **<3D_AccLimit>** to define the minimum positioning times and 3D position standard deviation used for the position estimation. The Fixed mode (**<Mode>** = 2) requires user to manually enter the receiver position coordinates. Any error in the base station position will translate directly into rover position error.

```
//Set:
$PQTMCFGSVIN,W,<Mode>,<CFG_CNT>,<3D_AccLimit>,<ECEF_X>,<ECEF_Y>,<ECEF_Z>*<Checksum><CR><LF>
